Turn-Key Solar Energy Solutions

Supporting sustainability efforts one project at a time.

earthconnect is one of the leading Engineering, Procurement and Construction (EPC) providers of solar and energy solutions to the commercial, industrial and large-scale sectors of the renewable energy market.

We deliver programs on a local, national and international scale.

Since 2009, we've established a reputation as a company committed to safety, performance and quality in providing best in class turn-key solar energy solutions.

earthconnect are accredited by the Clean Energy Council as solar system designers and installers as well as being EcoSmart accredited engineers. We are also members of the Smart Energy Council.

All Roof Mount solar services by earthconnect include operation and maintenance programs complete with back-office monitoring, to give you peace of mind knowing that our designs are consistently performing beyond expectations.

Our expertise

Expect the best with a full in-house end-to-end solar solution.

We'll provide you with accurate predictions using industry-leading power system modelling tools that compare yields for individual sites and includes comprehensive information to precisely evaluate feasibility for grid connect hybrid and stand-alone solar systems.

We also offer:

- Financial and production modelling that reflects user tariffs and captured value;
- Electricity market analysis;
- Risk management profiling;
- Grid connect, hybrid and stand-alone solar system design;
- Product selection and optimisation;
- Energy generation and distribution optimisation;
- Cost and budget planning and management;
- System installation;
- Comprehensive 24/7 software monitoring of system performance; and
- Coordination of building and planning approval (where required).

Medium and large scale Roof Mount energy solutions require diverse and specialist skills to design, install and commission, which is why you can trust in earthconnect to ensure your solar project is delivered to the highest standard to provide maximum efficiency and effectiveness.

Our experience

Known for being capable and professional.

Our experienced staff are skillful in undertaking all areas of *Project Management*, *Project Engineering* and *Project Delivery*, including:

- Feasibility;
- Preliminary Design;
- Critical Design;
- Structural Adequacy Assessment
- Construction;
- Testing;
- Commissioning;
- Operation; and
- Maintenance.

Our team includes:

- Mr Adam James** – Managing Director
- Mr Jason Marko** – Technical Director
- Mr Darcy Haines** – Project Manager
- Mr Michael McGregor** – Project Engineer
- Mrs Shelbee Miller** – Operations Manager
- Mrs Amy Page** – Administration Manager

Our Value Offering

We are committed to providing outstanding work regardless of project size or complexity.

earthconnect has delivered multiple megawatts of solar energy solutions, mostly through repeat work.

earthconnect also took on a pivotal role in the delivery of an 8.0MW solar farm project in the Asia Pacific region.

Our scope is broad, and because every project is managed in-house by our professional team, we have a consistent track record of success.

At earthconnect, we take appropriate steps to ensure processes are put in place to manage or eliminate any potential environmental impacts that may occur during the design phase, throughout construction or post-delivery.

Our objective throughout the project lifecycle is to deliver an asset which will represent value for the client.

Which is why every project earthconnect delivers includes four (4) quarterly complimentary on-site inspections to ensure every system is operating at its full potential.

Additionally, to give us better insight into how a system is running, we conduct remote system monitoring using platforms such as Sunny Portal and Solar Analytics.

Moreover, we may engage industry experts to provide independent assessments and advice for specific tasks like structural adequacy reviews.

We can also evaluate solar resources, estimate energy yields and losses as well as minimise risks to ensure bankability.

Furthermore, as our promise to you, we provide a comprehensive five (5) year scheduled/preventative maintenance program with every commercial Roof Mount installation.

Our Quality Assurance

We follow stringent quality standards that exceed our client's expectations.

We promise to deliver and carry out quality construction work following the manufacturer's installation guidelines and under our Quality Management Systems developed in line with QMS ISO 9001:2015.

To achieve this, we use a comprehensive ITP (Inspection and Test Plan) to review and assess works at every stage of construction.

Whether it be mechanical/structural ITP's, electrical ITP's, point to point or megohm tests, rest assured that all our QA results will be meticulously documented and filed.

FROM FEASIBILITY TO REALITY. SOME OF THE MANY PROCESSES REQUIRED TO PROGRESS A DREAM.

Project Feasibility Phase

From integrated project developer/EPC to various levels of project services, we'll tailor each service based on the needs of the project.

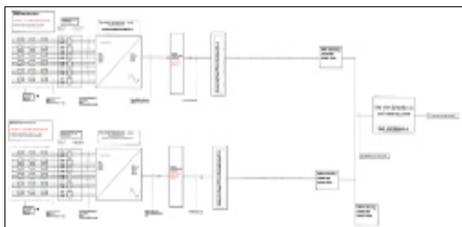

For any given project, the feasibility process is paramount. We consider a range of critical tasks to prove that the project will be constructable and bankable.

To come up with a proficient feasibility program, we take into account the following considerations:

- Structural adequacy assessment;
- Mechanical engineering design;
- Top level electrical design;
- Development application and approval; and
- Construction activities.

Top-Level Electrical Design

Below is an example of an SLD - Single Line Design.

Structural Adequacy Assessment

We first have our consulting engineers assess permissible loading for the proposed roof area. We'll use our judgement and experience to advise you as to where on the roof we deem suitable in estimating PV system sizing.

Our consulting engineers then review multiple images of the structural roof and support members as well as any engineering drawings available.

BELOW
A PORTION OF A
TYPICAL STRUCTURAL
ADEQUACY REPORT

Once the interim costings are approved, our consulting engineer will then conduct an on-site visit and perform a detailed assessment of the roof structure. They'll also perform a static and dynamic loading calculation to confirm the approved loading for each proposed roof area.

The results generally present a maximum allowable dead load/m² allowance, which is then compared to the expected static load of the solar array, mounting and associated cabling and cable tray.

Certification of Structural Adequacy
Proposed Solar Panel Installation to Existing Roof Areas.

As requested, the structural design check of the above existing factory buildings for solar panel loading was carried out by [REDACTED] Engineers Pty Ltd, as detailed in the following documentation:

- [REDACTED] Engineers Drawings: 7118: S01/A to S06/A
- [REDACTED] Engineers Drawings: 8486: S01/A to S04/E
- [REDACTED] Construction Drawings: [REDACTED] Solar Project, SK-01/A, SK-02/A
- The structure has been designed in accordance with the following Australian Standards:
 - AS/NZS 1170.0 - Structural Design Actions - Part 0 : General principles
 - AS/NZS 1170.1 - Structural Design Actions - Part 1 : Permanent, imposed and other actions
 - AS/NZS 1170.2 - Structural Design Actions - Part 2 : Wind actions
 - AS 4100 - Steel Structures
 - AS/NZS 4600 - Cold-Formed Steel Structures
- The following design loading parameters have been used:
 - Solar panel total load = 13 kg/m²
 - 50 kW inverter load = 82 kg each
 - Additional loads as per [REDACTED] Construction Drawing SK-03/A

I hereby certify, for & on behalf of [REDACTED] Engineers Pty Ltd, that the structural design review of the existing buildings has been carried out in accordance with the Building Code of Australia and the above referenced Australian Standards, and the existing building is structurally adequate to support the imposed loading.

The certification is only relevant to and based on the solar panel installation being carried out in accordance with, the abovementioned documentation. I certify that I am a fully qualified and practising structural engineer in accordance with the requirements of the Building Code of Australia and the Institution of Engineers, Australia.

Yours faithfully,
[REDACTED] Engineers Pty Ltd

CONTINUED. CONSTRUCTION PHASE

Mechanical Engineering Design

The mechanical engineering design process requires us to strictly follow the manufacturer's guidelines and the structural adequacy assessment.

Finalising the roof mounting design (anchoring points/m2 etc.) depends on the location (wind zone region) roof sheeting type, the mounting brackets used - penetrative or non-penetrative, as well as the purlin spacings and actual dead loads, kg's/m².

Although a solidly built mechanical structure will have an impact on the reliability and longevity of a Roof Mount asset, it can profoundly impact bankability if the proposed roof structure is incapable of supporting the additional load of a proposed PV system. And if the roof condition is ageing, it will end up needing to be replaced, which will also affect bankability.

For these reasons, we must conduct a comprehensive structural adequacy assessment for every site before commencing the construction phase.

Development Application (DA) and Approval Complying Development Certificate (CDC)

earthconnect are well versed in all aspects associated with achieving approval through the formal Development Application (DA) process.

Although some clients handle this process themselves, we are more than happy to manage it as part of our EPC role.

Each site contains its own set of challenges, and are generally unique.

Construction Activities

Pictured to the right are examples of our construction activities from previous projects.

Health and Safety

Both our Technical Director and Project Engineer conduct a full risk assessment on-site in consultation with the client's Site Safety Officer to:

- Determine the roof access, materials storage compound and ladder lift locations;
- Gain sign-off for the rooftop demarcated safe work zone areas; and
- To cordon off "harness only work zones".

This inspection then leads on to the development of the site-specific SWMS (Safe Work Method Statement) and daily pre-start inclusions.

Upon completion of the safety documentation, we send it off to the Site Safety Officer for their review and approval.

During construction and commissioning, every person who wishes to gain access to the roof top area whether earthconnect personnel or otherwise, must read, understand and sign onto our SWMS before gaining access.

Pre-start meetings are conducted every morning in the ground level compound before any staff member can begin work on the roof areas.

No individual may proceed beyond the rooftop flagged area unless they are:

- Harnessed;
- Accompanied by a second individual; and
- Trained to do so.
